

# WEB 303 - Javascript 2

## Chapter 7: jQuery Assignment 1

Start with the files given.

1. Include jQuery and `script.js` in the HTML file.
2. Edit the existing `script.js` file. Write your code inside a jQuery document ready function.
3. Create an event handler to run whenever the salary and percent fields have changed ("change" event).
4. In the event handler calculate the amount you can spend on gadgets and insert it into the `span#spend` element, with a dollar sign.
5. Test your code by entering values in both fields.
6. Try using the "keyup" event instead of "change". (your submission can use one or the other with no mark deduction)  
(What's the difference?)
7. Use the built in `toFixed()` method to round the number to dollars and cents. That will get rid of extra decimal places.
8. Upload your code to your repository on an `Assignment 1` branch. Submit the link to your branch on blackboard.

Math assistance -- The formula for this is:

$\text{salary} * \text{percent} / 100$
