

WEB 303 - Javascript 2

Chapter 8: AJAX and JSON

Assignment 2

When the user clicks on one of the 3 links in the `#content` block, load the correct content into the `#solution` div using AJAX.

You will need to use AJAX to bring in content to the index file from either the prospect, convert or retain file, based on the link the user clicks on the index page (i.e. if they click `a#vprospect`, you load in the content from the `prospect.html` file).

Once the content is loaded, animate the content onto the page using jQuery.

Note: Use Github Pages to run your assignment's branch.

Create a branch on your github repository called `Assignment 2`. Add your code from this assignment to your repository on that branch. Submit the link to your branch AND your Github Page running the code on blackboard.
